Subject: Pack goat objections

To whom it may concern,

I am writing to object to your current focus on pack goats as an etiology for MOVI among Big Horn Sheep. Please consider the newest research which is showing a deficiency in selenium as a co-factor in the Big Horn's immune system as the reason for their inability to fight a disease which some Big Horn sheep carry chronically. There is good evidence that 95% of pack goats do not even carry MOVI, much less interact with Big Horn Sheep. These goats are imprinted on their handlers and do not interact with wild species.

Very Respectfully,

Kaare Tingelstad, DO
